Date: _____

Frog Life Cycle

Frogs begin their lives as eggs in the water. The eggs hatch into

tadpoles, which have tails and breathe with gills.

As tadpoles grow, they start to get legs and their tails become smaller. They slowly begin to look more like frogs. When they are ready, they leave the water as adult frogs and live both on land and in the water.

What is the first stage of a frog's life cycle?

How does a tadpole change as it grows?

Where do adult frogs live?
