# Geometry and Fractions

Geometry is about shapes like circles, squares, and triangles. You can see these shapes on toys, in books, or at the park. Fractions show parts of a whole. If you cut a pizza into two equal pieces and eat one piece, you have eaten one half. Shapes and fractions help us describe and share things in our world.

What are three shapes you can find in geometry?

If you have a square and color in one part out of four, what fraction of the square is colored?

Where might you see shapes like circles or triangles around you?
