MAGNETS

Magnets are special objects that can pull some things, like paper clips and nails, toward them. Magnets have a strong side called the north pole and another side called the south pole. Magnets stick to things made of metal, and they can push or pull each other, too. We use magnets on our fridge to hold pictures and notes.

What do magnets stick to?

Where can you find magnets in your house?

What are the two sides of a magnet called?
