# Pollination

Pollination is how flowers make seeds. Bees, butterflies, and even the wind help move tiny grains called pollen from one flower to another.

When pollen moves to a new flower, it helps the plant grow fruit or seeds.

These seeds can become new plants, so pollination is very important for flowers and for us!

What helps move pollen from one flower to another?

\_\_\_\_\_

Why is pollination important for plants?

\_\_\_\_\_

Name two animals that help with pollination.
