READING A THERMOMETER

A thermometer helps us know how hot or cold it is. It has numbers and a red line that moves up or down. When the red line goes up, it means it is getting hotter. When the red line goes down, it means it is getting colder. We use a thermometer to check the temperature outside or inside the house.

What does a thermometer help us find out?

What happens to the red line when it gets hotter?

Where can we use a thermometer to check the temperature?
