# Warm-and Cold-Blooded

Some animals, like dogs, cats, and people, are warm-blooded. This means their bodies stay warm, even when it is cold outside. Other animals, like snakes, frogs, and fish, are cold-blooded. Cold-blooded animals get hotter or colder depending on the weather around them. Warm-blooded animals can play and move in the cold, but cold-blooded animals usually slow down when it is chilly.

What does it mean when an animal is cold-blooded?

---

Which animals are warm-blooded in the passage?

---

How do cold-blooded animals act when it gets cold outside?
